

BCA Blockchain Contract Audit

區塊鏈合約檢測服務

Project: RUG Token

Report date: June 24th, 2023

	Re-entrancy
	Overflow/underflow
	Use of block.timestamp
	Use of tx.origin
	Use of selfdestruct
	Storage conflict
	Force receive token
	Using inline assembly
	Access vulnerability
	Return value of low level call
	Return value of transfer
	Enable Trade

Audit Status: PASS

Vulnerabilities list	p.02
-----------------------------	------

Summary	p.04
----------------	------

Vulnerabilities Check	p.06
------------------------------	------

Conclusion	p.12
-------------------	------

Disclaimer	p.13
-------------------	------

Project name	RUG Token
Network	BSC
Language	Solidity
Delivery Date	2023/6
Contract Address	0x241cF521c6eB9dDd1B45b508749B4b3e33D41b0a

This audit report was summarised the smart contract verification service. The goal of this security audit is to guarantee that the smart contracts are perfect enough to avoid potential security vulnerability.

	Token Information
Fee	Yes
Fee Privilege	Yes
Ownership	Yes
Max Tx Amount	None
Blacklist	None
Decimals	9
Max Supply	1,000,000,000
Mint/Burn	None

Re-entrancy

If a contract has this vulnerability, when it calls an external contract, and does not update its status before sending funds, an attacker could continually call the withdraw function to transfer funds until all funds in the contract are depleted.

PASS

Overflow/underflow

When performing calculations on numbers, if the result exceeds or falls below the range of the type, an Overflow or Underflow vulnerability can occur.

PASS

Dependence on `block.timestamp`

Generating random numbers using global variables like `timestamp` can be predicted by attackers.

PASS

Use of `tx.origin`

When a contract uses `tx.origin` to verify user identity, malicious actors can exploit this vulnerability, masquerading as an address that can pass verification.

NONE

Use of selfdestruct

When a contract improperly uses the selfdestruct function, it can result in the contract being destroyed and its balance transferred to an address controlled by the attacker.

NONE

Storage conflict

If different variables share the same storage slot, it can lead to variables being maliciously altered by attacker.

PASS

Force receive token

If the balance of the contract is used as a check condition, the contract may become invalid if an attacker forces a transfer.

PASS

Using inline assembly

The use of assembly is error-prone and should be avoided.

PASS

Access vulnerability

Vulnerabilities in permissions may allow malicious actors to bypass identity checks for accessing functions, or to change the owner of the permissions.

PASS

Return value of low level call

This vulnerability refers to an issue where, during the execution of `call()`, a return value is typically given to indicate whether the function was successful or not. If this return value is not properly used, unexpected errors may occur.

NONE

Return value of transfer

This vulnerability refers to an issue where, during the execution of `transfer()`, a return value is typically given to indicate whether the transfer was successful or not. If this return value is not properly used, unexpected errors may occur.

NONE

Enable Trade

If the contract includes the "Enable Trade" feature, the project party has the right to disable users' token trading privileges. The users' assets will be at risk.

YES

Conclusion

This is an implementation of the ERC20 token standard that has been audited and found to have no vulnerabilities from the list.

This token operates on a dual-token model, where the quantity of tokens owned by users fluctuates based on the ratio of the sub-tokens. This token includes the `enableTrading` function, granting the contract owner the authority to halt token trading by users. Investors are advised to exercise caution and be aware of the risks involved.

Disclaimer

Before you use this website to fill in basic information, upload information and apply to this service, you have to read this Terms of Service on the website thoroughly to protect your right.

We only audit common hacking issues in the above smart contracts, and do not guarantee the business model of this project. Investment involves risks, please consider carefully before purchasing.
